## Guidelines for successful integrated pest management.

### What is integrated pest management (IPM)?

Integrated Pest Management is an approach to pest management designed to manage pests and diseases with as little damage as possible to people, the environment and beneficial organisms.

Strategies that prevent pests and diseases are the cornerstone of IPM. The IPM grower uses all possible crop protection techniques including monitoring, crop sanitation, cultural and mechanical control, and the introduction of beneficial insects and mites. Corrective chemical control measures are used as a last resort.

In this Koppert brochure you can familiarise yourself with all aspects of IPM. The conditions and guidelines are explained in the following sections:

- Integrated control
- Cultural control
- Crop sanitation
- Mechanical control
- Biological control
- Chemical control
- Monitoring

If you have any questions after reading this brochure, or if you would like advice about the implementation of IPM for your company, please feel free to contact us.
